

Mailsystem-Einstellungen

Drupal provides a default [MailSystemInterface](#) class called [DefaultMailSystem](#). Modules may provide additional classes. Each [MailSystemInterface](#) class may be associated with one or more identifiers, composed of a *module* and an optional *key*. Each email being sent also has a *module* and a *key*. To decide which class to use, Drupal uses the following search order:

1. The class associated with the *module* and *key*, if any.
2. The class associated with the *module*, if any.
3. The site-wide default [MailSystemInterface](#) class.

Theme to render the emails

Standard ▼

Select the theme that will be used to render the emails. This can be either the current theme, the default theme, the domain theme or any active theme.
